#### **IN THE SPECIFICATION:**

On page 2 of the Specification, the section heading above paragraph [0005] is amended to read:

Summary of the invention

### ***Allowable Subject Matter***

3. Claims 1-21 and 24-31 are allowed.

4. The following is an examiner's statement of reasons for allowance:

The closest prior art in the field, Kaysen, US 6,839,776, does not teach the combination of features of the claimed invention as set forth in the independent claims, particularly including:

As for claim 1: An apparatus comprising: a first adapter with hardware for storing a unique identifier; a second adapter, where the first adapter couples a first port associated with a computer peripheral to the second adapter, and where the second adapter couples the first adapter to a second port associated with a processor, where the processor has an associated software module that consults a list of identifiers within the first software module and where each of the identifiers is associated with a respective computer peripheral authorized for use with the processor; and means for enabling communication to and from the computer peripheral under control of the processor, and where the first adapter is destroyed when removed from the computer peripheral.

As for claim 2: An apparatus comprising: a first adapter with hardware for storing a unique identifier; a second adapter, where the first adapter couples a first port associated with a computer peripheral to the second adapter, and where the second adapter couples the first adapter to a second port associated with a processor, where the processor has an associated software module that consults a list of identifiers within the first software module and where each of the identifiers is associated with a respective computer peripheral authorized for use with the processor; and means for

enabling communication to and from the computer peripheral under control of the processor, and where the first adapter and second adapters comprise keyed-connectors, and where the first keyed-connector and the second-keyed-connector are keyed to each other.

As for claim 7: An apparatus comprising: a first adapter containing hardware for storing a unique identifier; a second adapter, where the first adapter couples a first port associated with a computer peripheral to the second adapter, and where the second adapter couples the first adapter to a second port associated with a processor, and where the first adapter and the second adapter are physically connected to one another; a first software module associated with the processor, where the first software module consults a list of identifiers within the first software module and where each of the identifiers is associated with a respective computer peripheral authorized for use with the processor; means for enabling communication to and from the computer peripheral under control of the processor, and a second software module associated with the processor, where the second software module: retrieves the unique identifier from the first adapter; compares the unique identifier with the list; and enables the communication if a match of the unique identifier is found in the list.

As for claim 8 An apparatus comprising: a first adapter including hardware for storing a unique identifier; a second adapter, where the first adapter couples a first port

associated with a computer peripheral to the second adapter, and where the second adapter couples the first adapter to a second port associated with a processor; a first software module associated with the processor, where the first software module consults a list of identifiers within the first software module and where each of the identifiers is associated with a respective computer peripheral authorized for use with the processor; means for enabling communication to and from the computer peripheral under control of the processor, and a second software module associated with the processor, where the second software module retrieves the unique identifier from the first adapter; compares the unique identifier with the list; enables the communication if a match of the unique identifier is found in the list; stores information indicative of not finding a match of the unique identifier in the list; and generates an email indicative of not finding a match of the unique identifier in the list.

As for claim 10: An apparatus comprising: a first adapter with hardware for storing a unique identifier; a second adapter, where the first adapter couples a first port associated with a computer peripheral to the second adapter, and where the second adapter couples the first adapter to a second port associated with a processor, where the processor has an associated software module that consults a list of identifiers within the first software module and where each of the identifiers is associated with a respective computer peripheral authorized for use with the processor; and means for enabling communication to and from the computer peripheral under control of the

processor, and where the first adapter and second adapter are physically connected to one another.

As for claim 12: An apparatus comprising: a computer peripheral comprising a first port; a host computer comprising a second port; a computer network comprising a third port and a fourth port, where the third port is coupled to the second port; a first adapter containing a first hardware for storing a unique identifier; a second adapter, where the first adapter couples the first port to the second adapter, and where the second adapter couples the first adapter to the fourth port, a first software module associated with the host computer, where the first software module consults a list of identifiers within the first software module and where each of the identifiers is associated with a respective computer peripheral authorized for use with the host computer and a second hardware for enabling communication to and from the computer peripheral under the control of the host computer, where the second hardware is contained within the second adapter.

As for claim 21: An apparatus comprising: a computer peripheral comprising a first port; a host computer comprising a second port; a first adapter containing a first hardware for storing a unique identifier; a second adapter, where the first adapter couples the first port to the second adapter, and where the second adapter couples the first adapter to the second port, and where the first adapter and the second adapter are

physically connected to one another; a first software module associated with the host computer, where the first software module consults a list of identifiers within the first software module and where each of the identifiers is associated with a respective computer peripheral authorized for use with the host computer; and a second hardware for enabling communication to and from the computer peripheral under the control of the host computer, where the second hardware is contained within one of the first adapter or the second adapter.

As for claim 26: An apparatus comprising: a computer peripheral comprising a first port; a host computer comprising a second port; a first adapter, where the first adapter contains a first hardware for storing a unique identifier, and further where the first adapter is destroyed when removed from the computer peripheral the first hardware; a second adapter, where the first adapter couples the first port to the second adapter, and where the second adapter couples the first adapter to the second port; a first software module associated with the host computer, where the first software module consults a list of identifiers within the first software module and where each of the identifiers is associated with a respective computer peripheral authorized for use with the host computer; and a second hardware for enabling communication to and from the computer peripheral under the control of the host computer, where the second hardware is contained within one of the first adapter or the second adapter.
